

Wave[®] Curtain Workroom Guide

Introduction to Wave

Wave is a neat and stylish curtain heading system by Silent Gliss. It is created through combining a specially designed heading tape and Wave glider-cord to get a soft and simple continuous wave effect.

The finished appearance is similar to that of eyelet curtains but fabric hangs directly below the track in a neat and uniform style.

Wave has some key advantages over traditional curtain heading systems:

- Minimised curtain stack
- Simple curtain dressing
- Form throughout the curtain drop
- Minimalist appearance
- Suits traditional and modern interiors
- Compatible with pelmets

Fabric Suitability

There is no standard test that will indicate whether a fabric is suitable for Wave. However, experience suggests it is normally suitable for:

- Voiles
- Lined cotton
- Interlined Silk
- Blackout lining
- Borders

The soft curves of Wave **do not** lend themselves to:

- Stiff fabrics
- Heavy embroidery
- Irregular vertical stripes
- Metallic threads

We recommend a simple test to indicate whether Wave will be suitable (see image right). Hold the top of the fabric in this way and see if the curtain follows a soft wave pattern without too much effort.

Even Wave curtains will require some dressing and training. The extent of this will depend on the flexibility of the weave of the fabric chosen.

Suitable fabric

Unsuitable fabric

Wave Track Options

You will be making your curtain on one of the following tracks.

Electric tracks: Systems Silent Gliss 5090/5200/5400

Metropole: Systems Silent Gliss 6120M/6130M/6100M/6140M/6160M/6150M

Hand operated curtain track: Systems Silent Gliss 3840W

Cord operated track: Systems Silent Gliss 3840

The maximum weight that the standard Wave heading tape can carry is 10kg per metre of track. However, the individual track weight restrictions still apply, use the lower of the two numbers. Wave with roller glider cord 6098W has much higher weight limitations. If in any doubt please contact Silent Gliss.

Consult the catalogue to see individual system weight graphs.

Wave Workroom Accessories

When specified, Silent Gliss Wave tracks are supplied with the Wave glider already included (these tracks are all available with standard gliders). You will need to have the following workroom accessories available to make the curtain itself:

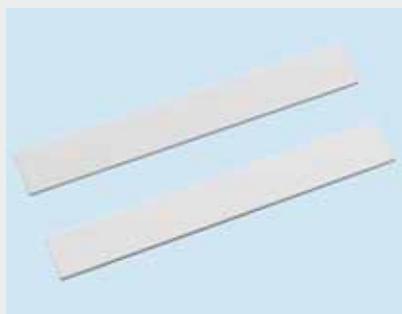

Wave Heading Tape 6349

Wave Iron on Tape 6363

Curtain Hook 3582

Curtain Side Weight 10076 (optional)

Curtain Weight Cord 10075 (optional)

There are additional, optional Wave components that can further improve and enhance the appearance of your curtain.

6364/6365 Extension arm and Carrier

- Allows a single stack curtain to reach the end of the track endset.
- Will take the curtain over an intermediate pulley on corded system 3840
- Allows the curtain to return to the wall better.

2255 Adjustable Brake

- Prevents the leading edge of the curtain creeping inwards.

With adjustable brake (front view)

Without adjustable brake (front view)

6366 Draw Rod Carrier

- Allows draw rod to be attached.

With adjustable brake (rear view)

With adjustable brake (rear view)

Planning Your Curtain – Glider Spacing

There are two sizes of glider cord – 60mm or 80mm spacing between the gliders. They offer slightly different looks:

The 80mm offers a deeper wave with a larger distance from the front to the back. The 60mm wave is shallower and smaller front to back, which lends itself to smaller recesses but will have a slightly larger stack back.

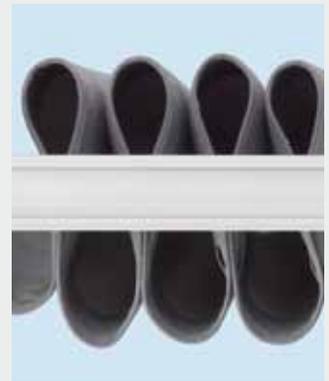

80mm Wave (front view)

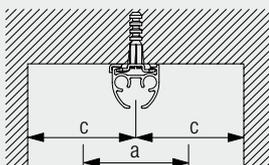

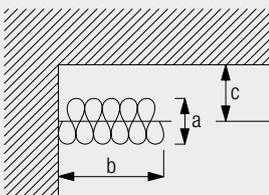

60mm Wave (front view)

80mm Wave (top view)

60mm Wave (top view)

a = Stack depth
b = Stack size
c = Min. distance

Glider-cord spacing	Curtain hook spacing	Approx. curtain fullness	Stack depth (a)	Stack width (b)	Min distance (c)
6	10	2.1	10	23 per metre of track + endpiece	8
6	12	2.3	12	23 per metre of track + endpiece	9
8	14	2.1	14	18 per metre of track + endpiece	10
8	16	2.3	16	18 per metre of track + endpiece	11

Wave standard with roller gliders

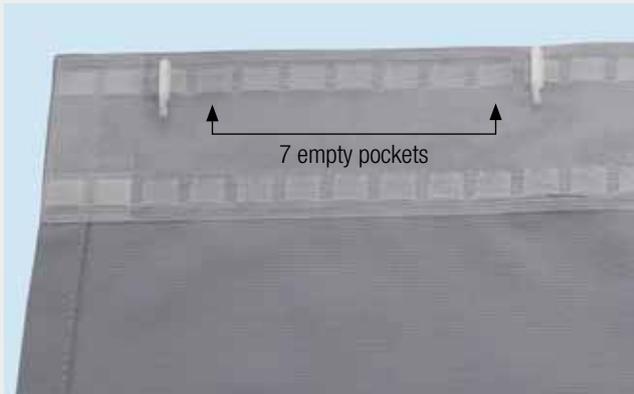

Glider-cord spacing	Curtain hook spacing	Approx. curtain fullness	Stack depth (a)	Stack width (b)	Min distance (c)
8	14	2.1	14	21 per metre of track + endpiece	10
8	16	2.3	16	21 per metre of track + endpiece	11

(dimensions in cm)

Note: Minimum distance (c) includes a standard 4.5cm clearance (front and back).

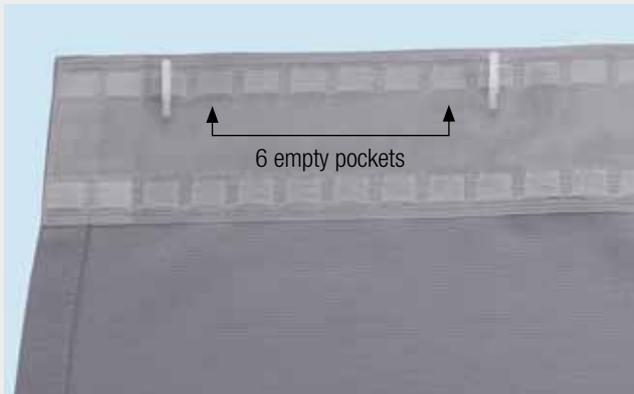

Important: The curtain fullness indicated in the chart above and throughout this guide applies to finished curtain fabric. You will need to allow additional fabric for joins, hems and your usual workroom allowances.

The final appearance of your Wave curtain will be influenced by the combination of your chosen glider cord and the curtain hook spacing. There are 4 possibilities:

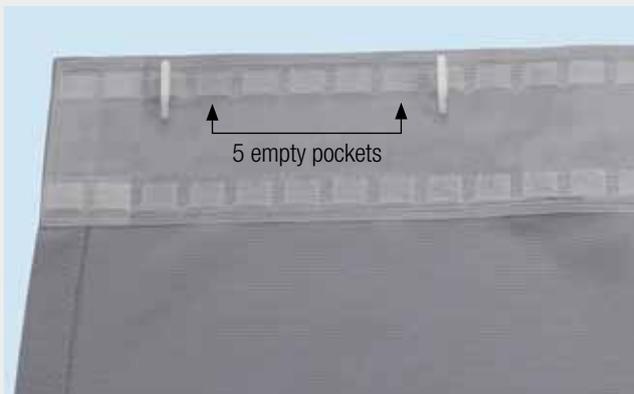

Option 1

Glider Cord = 80mm Spacing (Part number 6346)
Hook Spacing = 160mm
Pocket Spacing between hooks (PF*) = 7
Approx. Fabric Fullness = 2.3
Max. Depth of Wave (front to back) = 160mm

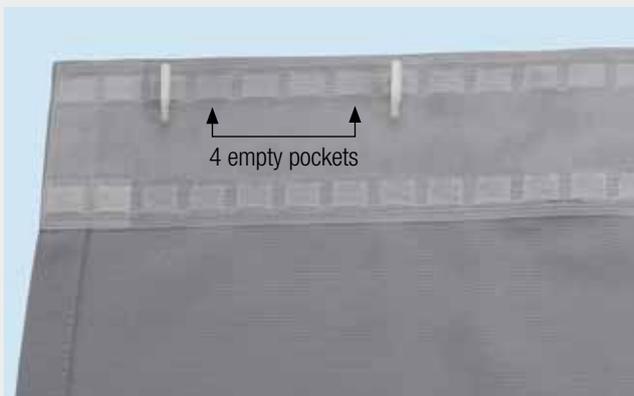

Option 2

Glider Cord = 80mm Spacing (Part number 6346)
Hook Spacing = 140mm
Pocket spacing between hooks (PF*) = 6
Approx. Fabric Fullness = 2.1
Max. Depth of Wave (front to back) = 140mm

Option 3

Glider Cord = 60mm Spacing (Part number 6345)
Hook Spacing = 120mm
Pocket spacing between hooks (PF*) = 5
Approx. Fabric Fullness = 2.3
Max. Depth of Wave (front to back) = 120mm

Option 4

Glider Cord = 60mm Spacing (Part number 6345)
Hook Spacing = 100mm
Pocket Spacing Between Hooks (PF*) = 4
Approx. Fabric Fullness = 2.1
Max. Depth of Wave (front to back) = 100mm

Note: If your track is using 80mm glider cord you need to confirm if it is using standard or roller gliders.

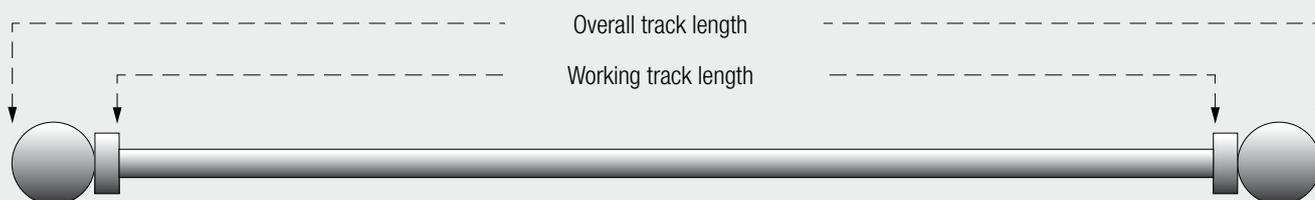

* PF = Pocket Factor

Establish The Working Track Length

Silent Gliss offer a Wave calculator which will advise the number of gliders and Wave heading tape required. For ease of curtain make-up Silent Gliss strongly recommend that you use this free and simple tool detailed on the following page. Contact Silent Gliss.

However, if you do not have access to this calculator then you will have to do a manual calculation.

First, you need to know your working track length in mm. If you obtain this from your track supplier be sure to confirm it is the working track length (excluding finials and cording sets) and not the overall track length.

Use the table below to calculate your working track length.

Metropole finial deduction table

System	Finial	Deduction per finial (x2)
6100	Shard	116mm
6120	Strata	33mm
6120	Groove Ball	95mm
6120	Design Endcap	20mm
6120	Ball End	70mm
6130	Design Endcap	20mm
6130	Groove Ball	85mm
6130	Groove Cylinder	85mm
6130	Strata	65mm
6130	Vega Cylinder	80mm
6130	Vega Cube	60mm
6130	Shard	127mm
6130	Design Endcap	20mm
6130	Ball End	70mm
6130	Crystal Cube	55mm
6130	Crystal Cylinder	55mm
6140	Ball End	125mm
6140	Strata	65mm
6140	Groove Cylinder	125mm
6140	Crystal Cube	55mm
6140	Crystal Cylinder	55mm
6150	Strata	65mm
6150	Groove Cylinder	125mm
6150	Crystal Cube	55mm
6160	Strata	33mm

Track deduction table

System	Operation	Deduction
3840W	Hand	None
3840	Cord	70mm
5090 Autoglide	Electric	128mm
5200/5400	Electric	105mm
6100 Metropole (Metroflat)	Hand	None
6130 Metropole (30mm)	Hand	Finials (x 2)
6120 Metropole (30mm)	Cord	80mm and then any Finials (x 2)
6140 Metropole (50mm)	Hand	Finials (x 2)
6160 Metropole (50mm)	Cord	80mm and then any Finials (x 2)
6150 Metropole (50mm)	Electric	105mm and then any Finials (x2)

Calculate The Number of Gliders

Using your working track length, the next step is to calculate the number of gliders used per curtain. Once you know this, it will help in the following stages for the curtain make-up.

There are two ways to do this:

1. Use the Silent Gliss Wave Excel Calculator

This useful tool is available free of charge. You simply input a few pieces of key information and it automatically calculates the gliders used. Contact Silent Gliss Ltd. 01843 863571 or download from www.silentgliss.co.uk.

Click on yellow boxes to select or enter details	
Note: For 3840 hand drawn use 6101 calculation	
System	3840
track size	1500
Pair or single stack	P
Glider cord/Curtain hook spacing	60 100
Calculated number of gliders per curtain is	14
Calculated number of pockets per curtain is	76

2. Use the Silent Gliss tables

The tables on the following pages state the number of gliders required per curtain. If your exact working track length is not listed use the next size up.

Calculate The Number of Gliders – 80mm Glider Cord

Track length mm	No. of Gliders per curtain		Track length mm	No. of Gliders per curtain		Track length mm	No. of Gliders per curtain	
	Single Stack	Pair Stack		Single Stack	Pair Stack		Single Stack	Pair Stack
400	6		5360	68	36	10320	130	66
560	8	6	5520	70	36	10490	132	68
720	10	6	5680	72	38	10650	134	68
880	12	8	5840	74	38	10810	136	70
1040	14	8	6000	76	40	10970	138	70
1200	16	10	6160	78	40	11130	140	72

3780	64	34	7500	126	64			
3900	66	34	7620	128	66			

Calculate The Length of the Heading Tape

Next, use the number of gliders calculated from the previous stage to determine the length of your heading tape. We strongly advise that you do not cut your fabric until you have confirmed the length of the heading tape

Again, there are two ways to calculate how much heading tape you require.

1. Use the Silent Gliss Wave Excel Calculator

This useful tool is available free of charge. You simply input a few pieces of key information and it automatically calculates the heading tape required. Contact Silent Gliss Ltd. 01843 863571 or download from www.silentgliss.co.uk.

Click on yellow boxes to select or enter details	
Note: For 3840 hand drawn use 6101 calculation	
System	3840
track size	1500
Pair or single stack	P
Glider cord/Curtain hook spacing	60 100
Calculated number of gliders per curtain is	14
Calculated number of pockets per curtain is	74

2. Manual Calculation

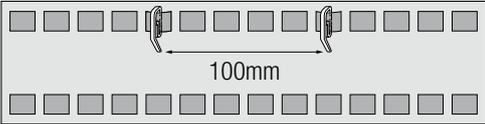

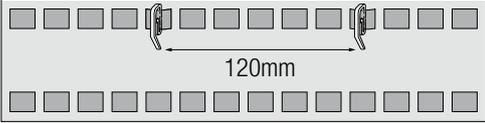

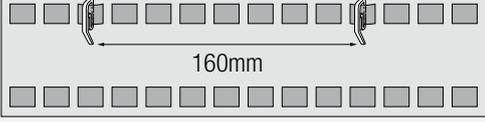

To calculate the length of the tape follow these steps:

- Step 1: Take the number of gliders for the previous chart
- Step 2: Subtract 1
- Step 3: Multiply this number by your PF (Pocket Factor) see chart below
- Step 4: Add back on the total amount of glider from Step 1
- Step 5: Add on a further 8 pockets

Working example based on a System 3840, 1500mm wide with a pair stack. Using 60mm glider cord with 100mm hook spacing:

- Step 1: 14
- Step 2: $14 - 1 = 13$
- Step 3: $13 \times 4 = 52$
- Step 4: $52 + 14 = 66$
- Step 5: $66 + 8 = 74$ pockets

Therefore your tape length will be equal to 74 pockets. Do not cut your fabric yet!

Glider-cord spacing	Curtain hook spacing	Pocket factor
		4
		5
		6
		7

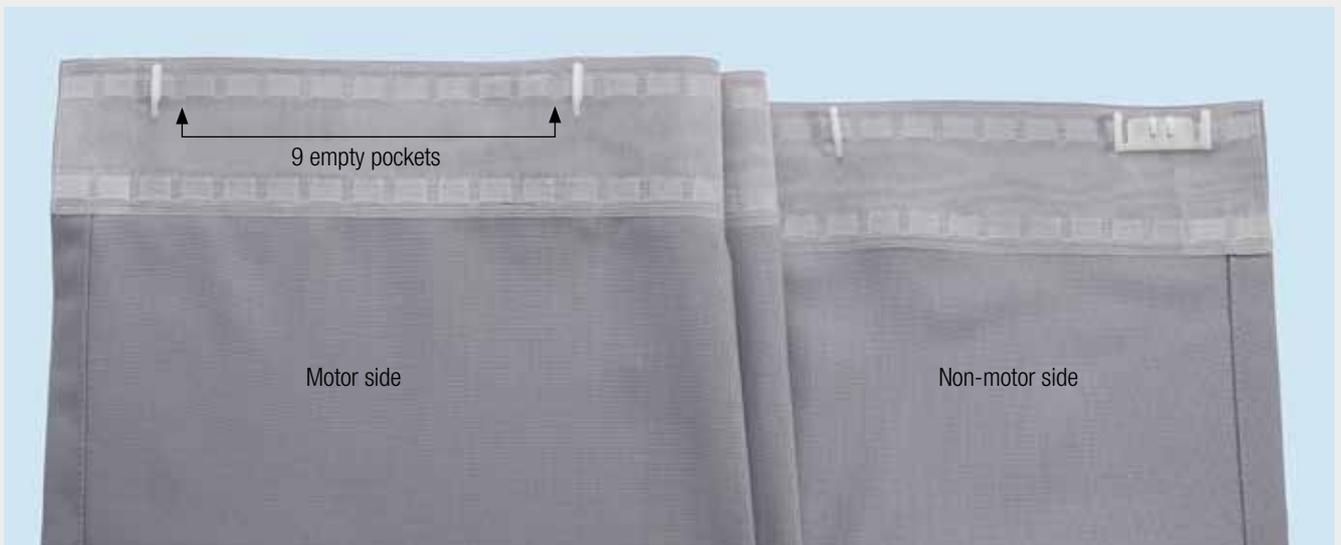

For Electric Tracks please see the following page.

When using electric tracks

When using electric tracks, additional pockets are required in order to allow the curtain to wrap around the motor.

Add the following pockets to the total calculated above depending on your glider cord and hook spacing combination:

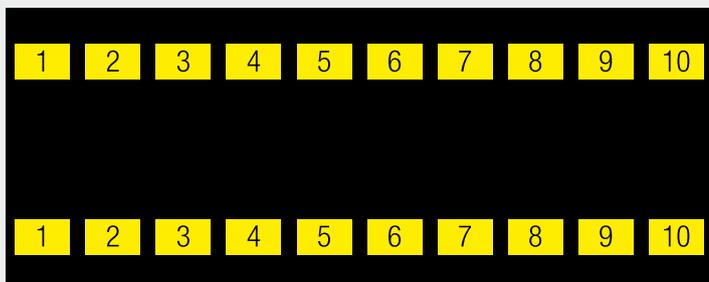

Glider cord	Hook spacing	Additional pocket
60mm	100mm	5
60mm	120mm	4
80mm	140mm	3
80mm	160mm	2

Cutting The Heading Tape

You now need to cut your heading tape according to the exact amount of pockets calculated above.

For larger curtains you may find the cutting guide template included at the back of this booklet useful. It allows you to count 10 pockets at a time. A 20 pocket template is available free of charge on request from Silent Gliss.

Pocket cutting template: Not to scale, see back of this booklet for actual guide.

The calculated pockets included 4 for turning (2 at each end). Therefore fold 2 pockets under each side.

This is the finished width of your curtain. You can use this dimension to cut your fabric. Add on any usual allowances you make for your preferred make up method.

Making The Curtain

Hemming Tape

We recommend you use the Wave Hemming Tape (part no. 6363) to avoid fabric puckering. It gives a professional finish to the top of the hem. This applies to all fabrics, including lined curtains.

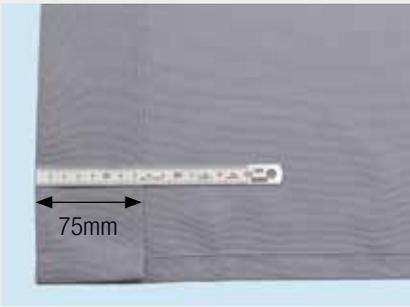

Wave **without** the iron-on Wave Hemming Tape

Wave **with** the iron-on Wave Hemming Tape

For Unlined Curtains

With standard Wave glider cord measure to 75mm and then iron the hem into position. If using 6098W roller gliders increase the hem depth to 110mm. Lift the hem back and lay on the iron-on tape. Iron the hem so that the tape melts and sticks the 2 parts of the curtain together.

For Lined Curtains

For lined curtains the iron-on tape is positioned between the front curtain fabric and the lining as pictured.

For 6098 Roller Gliders

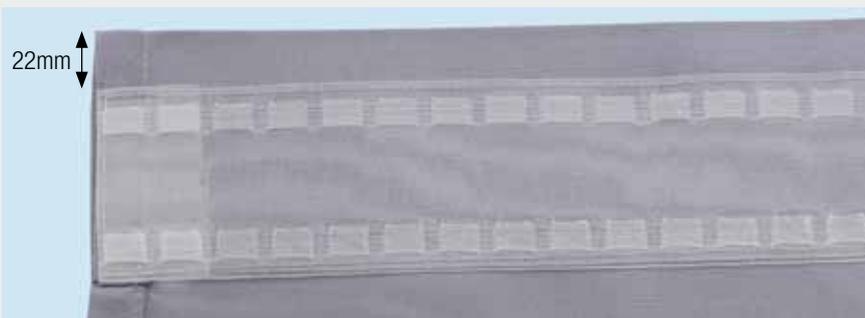

When using glider cord measure the hem to **95mm** and then use **two** rows of iron-on tape to cover the whole depth of the hem.

Sewing the Tape

Above: Wave tape positioning with standard glider cord

Above: Wave tape positioning with roller glider cord

Standard Gliders

If you are using standard Wave glider cord then sew the heading tape to the top of the curtain.

Roller Gliders

If you are using glider cord sew the tape **22mm** from the top of the curtain.

In both situations, the tape has been designed to give the correct hook drop when sewn in the correct position.

Curtain Hook Placement

Standard Wave Components

The first hook always goes into the 3rd pocket from the leading edge and then hooks are inserted as required according to the relevant pocket factor (see chart below).

E.g. pocket factor = 5 then insert a hook every 6th pocket (5 pockets are left empty).

Glider-cord spacing	Curtain hook spacing	Pocket factor
		4
		5
		6
		7

Standard Wave components for electric tracks

On motor side curtain, the last pocket spacing will be increased to 9 pockets to allow the curtain to wrap around the motor. This was allowed for in the original pocket calculation.

So for the last hook your pocket factor will be as per the table right.

Remember, your last hook will always be the 3rd pocket in from the end.

Glider cord	Hook spacing	Additional pocket	New Pocket factor
60mm	100mm	5	9
60mm	120mm	4	9
80mm	140mm	3	9
80mm	160mm	2	9

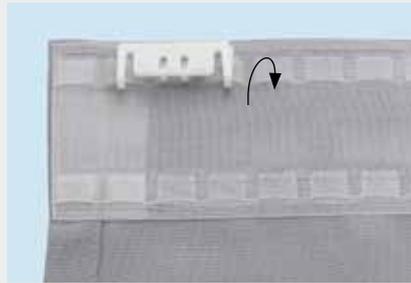

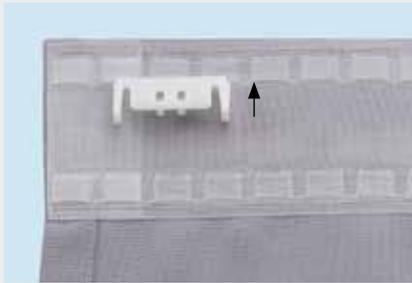

Wave With Optional Extension Arm/Carrier

Insert the first hook of the carrier of the extension arm into the 3rd pocket of the tape (this will mean the 2nd hook will attach in the 5th pocket).

The next hook will be your pocket factor less 1. e.g. if you're pocket factor would normally be 7 then only leave 6 from the end of the carrier. Thereafter insert curtain hooks as per the pocket factor in the table above.

When you reach the end of the curtain the last hook is replaced by another carrier, therefore your last pocket factor will be one less.

Positioning the carrier

Standard Wave Components for Electric Tracks (with Extension)

On the motor side curtain, you will only have the extension carrier on the leading edge. The motor side will be as per the picture below. The last pocket spacing will be increased to 9 pockets to allow the curtain to wrap around the motor. This was allowed for in the original pocket calculation. So for the last hook your pocket factor will be as per the table below.

Remember, your last hook will always be the 3rd pocket in from the end.

Front

Reverse

Glider cord	Hook spacing	Additional pocket	New Pocket factor
60mm	100mm	5	9
60mm	120mm	4	9
80mm	140mm	3	9
80mm	160mm	2	9

Dressing The Curtain

One of the many advantages of Wave is that it is comparatively simple to dress. When hanging the curtain pull the first fold towards you and push the second backwards. Continue to the end of the curtain.
